DETAILED ACTION

Amendment

1. Receipt is acknowledged of the amendment filed 19 September 2006.

Terminal Disclaimer

2. The terminal disclaimer filed on 21 September 2006 disclaiming the terminal portion of any patent granted on this application which would extend beyond the expiration date has been reviewed and is accepted. The terminal disclaimer has been recorded.

Examiner Comment

3. Although had indicated allowable subject matter in the office action mailed 19 June 2006, upon further consideration and search, has found prior art to reject the claims. Accordingly, this action is a non-final action. Examiner apologizes for any inconvenience.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1, 11, 21, and 31 are rejected under 35 U.S.C. 103(a) as being unpatentable over Maier (U.S. Patent Application Publication No. 2005/0251596) in view of Tello (U.S. Patent No. 6,463,537).

Regarding claims 1, 11, 21, and 31, Maier teaches an integrated circuit for a smart card comprising a transceiver and a processor (smart card) for communication with a host (personal computer PC) via the transceiver and performing a plurality of smart card application, said processor for cooperating with the host device to perform an enumeration (ENUM1) based upon at least one default descriptor (descriptors I) (see Figure 1, paragraphs 38-44).

Although Maier teaches of an active memory to which drivers are loaded, Maier fails to teach the step of generating a look-up table for allocating data to respective smart card applications based on the enumeration, and detecting a system event, and responsive to the system event, cooperating with the host device to perform a new enumeration based upon at least one alternate descriptor and generating a new look-up table thereon.

Tello teaches a computer security system which utilizes an encrypted table of smart card code numbers are also stored in the flash memory of the security engine. This table is used during the operation of the invention to identify the purpose and type of smart card inserted in the smart card reader which is logically connected to the security engine (see col 9, lines 26-31). Hence, Tello teaches the use of a look-up table which stores smart card information during smart card processes.

In view of the teaching of Tello, it would have been obvious to one of ordinary skill in the art at the time the invention was made to employ a look-up table, and subsequent look-up tables because it is favorable to be able to obtain information and be able to access it at a later time.

Allowable Subject Matter

5. Claims 2-10, 12-20, 22-30, and 32-38 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

6. The following is a statement of reasons for the indication of allowable subject matter: The best prior art of record fails to specifically teach the subsequent steps of the data placement in the look-up table (i.e. applications with their associated endpoints, and alternate descriptors in the form of device, configuration or interface descriptors).
